

Introduction to Artificial Intelligence

Tutor Group ...

2nd & 3rd of October 2024

TAs: ... & ...

Tutor: ...

TODAY'S AGENDA

01

SENTIMENT CHECK

How do you feel about the course so far?

02

GROUP PRESENTATIONS

5 minutes presentation with slides on Approach Assignment

03

EXPERIMENTAL EVALUATION

A brief recap...

04

FOR NEXT TIME...

POSTERS & VIDEOS! :)

INTRO TO AI SOCIAL EVENT

18th of October 2024

Posters Presentation 15.00-18.00h

Best Video & Poster Election

Drinks & Buffet 17.00-19.00h

More details coming soon...

01

SENTIMENT CHECK

HOW DO YOU FEEL ABOUT THE COURSE SO FAR?

... AND WHY?

02

GROUP PRESENTATIONS

03

EXPERIMENTAL EVALUATION

- Research questions
- Hypothesis
- Conditions: Control & Experimental
- Independent variable
- Dependent variable
- Test subjects
- Possible confounding variables

Do not forget to provide information about the questionnaire that will be used to **evaluate your system** (acceptability/feasibility/cost-effectiveness, etc.). Which categories are you going to investigate? What do these questions lists measure? Provide examples.

04

FOR NEXT TIME...

Present your Poster & Video!

You can find some nice examples in the next slides :)

Also, if they are not ready, you're still welcome to present a draft ! :)

Fire Prediction System

Group 29

How can we use an intelligent system to help control and diminish the damage caused by forest fires?

A. Introduction

A system that uses drones and real-time data to predict forest fire movement and provide solutions for dealing with it.

B. Literature

Keywords in use: Wildfires, Drones, AI, Meteorology, Control, Greece, Infra-Red camera, Air Component

Key findings:

- Factors which contribute to forest ignition
- Drone technologies that can be used for solving problem
- Sensors and modeling solutions for predicting fires

C. Evaluation

testing sensor and drone performance, fire modeling, and fire retardant effectiveness, with the hypothesis that accurate data will lead to precise predictions and effective response in real-life wildfires.

D. Results

During a wildfire outbreak, drones collect live data with various environmental sensors, which will be processed using Knowledge Representation and Machine Learning.

The system creates a model of the fire and suggests a fire management strategy considering historical fire and meteorological data and available equipment. Firefighters

The system has completed its task when the fire has been contained. Minimizing the total damage caused by the fire.

E. Processes

**STAY SAFE
WITH SUBSAFE**

SUBSAFE ENSURES A HEALTHY
RELATIONSHIP BETWEEN YOU AND
YOUR SUBSTANCES

SubSafe 16:32 AM

Hi Johnny, I'm SubSafe. I am your
new substance companion.
